

120kW DM lithium battery energy storage cabinet vs sodium-sulfur battery

What is the difference between lithium and sodium ion batteries?

There are differences in the physicochemical properties of sodium and lithium, which result in distinct electrochemical performance characteristics between the two. The larger mass and radius of sodium ions lead to a slower migration rate in sodium storage materials, which is not conducive to improving the rate performance of sodium-ion batteries.

Why do sodium ion batteries have a lower energy density?

The larger mass and radius of sodium ions lead to a slower migration rate in sodium storage materials, which is not conducive to improving the rate performance of sodium-ion batteries. This also results in the energy density (mass/volume) of sodium ion battery being lower than that of lithium-ion batteries.

Will lithium ion batteries replace sodium ionic batteries?

Instead of replacing them, sodium ion and lithium ion batteries will coexist, serving different needs. Lithium ion batteries will remain dominant in high-energy applications, while sodium ion batteries will address cost-sensitive, safety-critical, and stationary storage needs.
