

Can battery energy storage systems participate in primary frequency control?

A Control Strategy for Battery Energy Storage Systems Participating in Primary Frequency Control Considering the Disturbance Type. IEEE Access 9, 2169-3536. doi:10.1109/access.2021.3094309 Mercier, P., Cherkaoui, R., and Oudalov, A. (2009). Optimizing a Battery Energy Storage System for Frequency Control Application in an Isolated Power System.

Can large-scale battery energy storage systems participate in system frequency regulation?

In the end, a control framework for large-scale battery energy storage systems jointly with thermal power units to participate in system frequency regulation is constructed, and the proposed frequency regulation strategy is studied and analyzed in the EPRI-36 node model.

Are battery frequency regulation strategies effective?

The results of the study show that the proposed battery frequency regulation control strategies can quickly respond to system frequency changes at the beginning of grid system frequency fluctuations, which improves the stability of the new power system frequency including battery energy storage.

How can battery energy storage respond to system frequency changes?

The classical droop control and virtual inertia control are improved with battery charge as feedback. Also, the battery energy storage can respond to system frequency changes by adaptively selecting a frequency regulation strategy based on system frequency drop deviations.

An adaptive control approach is proposed in this work to improve the MG stability in the presence of PV and battery energy storage systems (BESSs).
