

Photovoltaic (PV) system is an essential part in renewable energy development, which exhibits huge market demand. In comparison with traditional rigid-supported photovoltaic (PV) ...

In this paper, we investigated the wind force coefficients for designing PV panels installed on hip roofs of rectangular and L-shaped low-rise buildings.

It delves into the techniques used to fabricate perovskite films, with a special emphasis on large-area and large-scale PSC manufacturing methods. Moreover, the review highlights stability concerns that ...

To address this gap, a numerical model alongside a novel EANN was employed to simulate the system's electrical characteristics, including open-circuit voltage, short-circuit current, ...

This research investigates the wind-induced vibration response of a multi-row flexible photovoltaic system using large eddy simulation and the two-way fluid-solid coupling approach.

In this study, a 45 m span flexible PV support structure with 3 spans and 12 rows was designed. The wind loads on PV panels were obtained by wind tunnel tests on a rigid model and the ...

To address this gap, a numerical model alongside a novel EANN ...

The conclusions are significant for identifying the basic physical mechanisms and dynamic evolution of the flow field, providing a reference for optimizing and predicting the wind load ...

This paper optimizes the design of a novel large-span cable-supported steel-concrete composite floor system in a simply supported single-span, single-strut configuration, aiming for cost-effective ...

This paper presents a systematic work around the wind-induced response and instability characteristics of the large-span flexible PV support array, the results are of significance for the ...

Guidance on designing and operating large-scale solar PV systems. Covers location, design, yield prediction, financing, construction, and maintenance.
