

What is the power curve of PV-storage system in tracking pv mode?

According to the above parameters, the PV-storage system is operated in tracking PV mode, the initial PV output power is 150 kW, the PV power mutates to 200 kW at 20s, and the PV power mutates to 250 kW at 40s, and each power curve is shown in Fig. 9. Fig. 9. Power curve of PV step disturbance in tracking PV mode.

Can photovoltaic equipment provide continuous energy storage?

The photovoltaic equipment in the power grid cannot provide continuous energy storage,so in order to simulate the heavy inertia of the traditional power grid,the system must be equipped with energy storage units and ensure the continuous normal operation of the energy storage units.

How is a PV-storage system operated in constant power mode?

The PV-storage system is operated in constant power mode with the VSG inertia parameter of $J = 2 \times 10^{-4} \text{ kg m}^2$ and the power reference value of $P_{ref} = 150 \text{ kW}$. The simulation results of each power curve during steady-state operation and load step disturbance are shown in Fig. 7.

Can a selective input/output strategy improve the life of photovoltaic energy storage (PV-storage) synchronous generator?

In this paper,a selective input/output strategy is proposed for improving the life of photovoltaic energy storage (PV-storage) virtual synchronous generator (VSG) caused by random load interference,which can sharply reduce costs of storage device. The strategy consists of two operating modes and a power coordination control method for the VSGs.
