What is a base station energy storage capacity model?

Based on the base station energy storage capacity model established in contribution (1), an objective function is established to minimize the system operating cost in the fault area, and the base station energy storage owned by mobile operators is used as an emergency power source to participate in power supply restoration.

How is a backup energy storage model established?

The backup energy storage model of the base station is established by combining the node vulnerability, load level and the communication volume of the corresponding area. The energy storage output range of the base station is finally determined.

Does a base station energy storage model improve the utilization rate?

Where traffic is high, less base station energy storage capacity is available. Compared with the fixed backup time, the base station energy storage model proposed in this article not only improves the utilization rate of base station energy storage, but also reduces the power loss load and power loss cost in the distribution network fault area.

How does base station Energy Storage differ from traditional energy storage equipment?

However, base station energy storage differs from traditional energy storage equipment. Its capacity is affected by the distribution of users in the area where the base station is located, the intensity of communication services, and the reliability of the power supply.
