

Solar power stations interfere with aircraft

Reflecting sunlight can potentially cause glare or glint to flight crew during the approach or take off, resulting in a loss of situational awareness and loss of control.

The Federal Aviation Administration (FAA) published a final policy aimed at ensuring that airport solar projects don't create hazardous glare. The policy requires airports to measure the visual impact of such ...

The aviation authorities in several States routinely require airports to assess the reflection of sunlight from solar panels. To date, we are not aware of an assessment of electro-magnetic ...

Solar reflections can impact pilots and cause safety concerns, and locating solar developments on airports can heighten this risk. In this article we will review a study examining ...

Provide recommendations for integrating into airport planning and capital development programs. Provide recommendations for successful implementation: How airports can construct, install, operate, and maintain ...

Solar PV systems are being installed in airports across the globe. It is a relatively new application of solar PV technology with a potential impact on aviation safety. The main objective of this paper is to ...

Explore key considerations for airport solar and microgrid installations, including FAA compliance, utility coordination, and energy resilience.

A key safety concern when considering a solar photovoltaic panel development on- or off-aerodrome is related to the reflection of sunlight off the photovoltaic panels commonly referred to as glint and glare.
